polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mENA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure

Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACB-2) polypeptide useful for detecting an ACB-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure.

Example; Page 105; 138pp; English.

PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure

PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a nubject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang.(1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction;
                                                                                                                                                                                                                                                                                 Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure.

PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                          Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 24 BP; 6 A; B C; 4 G; 6 T; 0 U; 0 Other;

Acton S, Robison KE,

Hsieh FY;

Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.

Example 10; Page 115; 218pp; English.

```
The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polymuclectides. ACE-2 is also known as peptidyl dipeptidase A (BC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, archerant failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA

Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.

Example 10; Page 116; 218pp; English.

for The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynuclectides. ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The polymorphism (SSCP) analysis of human ACE-2 DNA

The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidy1 dipeptidase A (EC 34.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.
                                                                                                                                                                                                    Human, angiotensin converting enzyme-2; ACE-2; therapy, hypertension, peptidyl dipeptidase A; blood pressure; hypotension; atherosclerosis; myocardial infarction; heart failure; arrhythmia; renal failure; inflammation; fertility; enzyme; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 24; DB 1; Length 24;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ace2e2c PCR primer for SSCP analysis of human ACE-2 DNA.
                                                                                                                                                               ace2e2b PCR primer for SSCP analysis of human ACE-2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 24 BP; 6 A; 8 C; 4 G; 6 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.7%; Scor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polymucleotides. ACE-2 is also known as peptidyl dispetidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or

ACE-2 is also known as peptidyl dispeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, enronic heart failure, mycoardial infraction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation
                                                                                                                                                                                                                                                                                                                                                                                Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or

                                                                                                                                                                                                                                                        The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidy1 dipeptidase A (EC 34.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammantory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                               Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ss; aminopeptidase P; XPNEP2; bradykinin receptor B1; primer; BDKRB1; tachykinin receptor B1; TACR1; C1 esterase inhibitor; C1NH; kallikrein 1; KLK1; bradykinin receptor B2; BDKRB2; gene therapy; angiotensin converting enzyme 2; ACE2; protease inhibitor 4; P14; polymorphism; haemangioma; tumour; sarcoma; Crohn's disease; trachoma; cardiovascular disease; angina pectoris, hypertension; heart failure; myocardial infarction; ventricular hypertrophy; vascular disease; aneurysm; embolism; thrombosis; coronary artery disease; angioedaema; arteriosclerosis; atherosclerosis hypersensitivity; sepsis; PCR; autoimmune disease; inflammatory arthritis; cancer; wound; genotyping; viral infection; bacterial infection; fungal infection; COPD; chronic obstructive pulmonary disease; enterocolitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRB1), reachesia inhibitor (CIMI), kalikrein accoptor B1 (MCR1), cresterase inhibitor (CIMI), kalikrein accoptor B1 (MCR2), or comprising at least one converting enzyme 1 (MCR1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme C 2 (ACE2) or protease inhibitor 4 (PT4), comprising at least one polymorphic position as provided in the detailed summary of single collymorphic position as provided in the detailed summary of single polymorphic position as provided in the detailed summary of single conformation of an ample from one or more individuals and determining the nucleic acid sample comprising of mucleic acid sample from one or more polymorphic positions in a gene encoding a protein selected from the group above, (3) constructing (M2) an individual at risk of developing a disorder using the polymorphic positions within a gene encoding a protein selected from the group above; and (6) genotyping (M4) an individual comprises one or more polymorphic positions within a gene encoding a uniquidual comprising obtaining a nucleic acids sample, acids individual at least one polymorphic positions within a gene encoding a nucleic acide present in at least one polymorphic position, and comparing of least one position with a known data set. The genes, (M1, M2, M3 and M4) and composition with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diseases like angina pectoris, corpusing various disorders such as angioedaema and diseases which involve angiogenesis like haemangions, thunours, sacromas, crohn's disease, arteriosclerosis and/or atherosclerosis, and cardivosacular diseases like angina pectoris, hypertenenion, heart failure, myocardial infarction, ventritual crohnwary disease, arteriosclerosis and/or atherosclerosis, and carbinate (CCC) and compositions sepais, autoimmune diseases, arteriosclerosis and/or atherosclerosis, and carbinate (

ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang.(1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction; renal failure; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure

PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a bubject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, angiotensin converting enzyme-2, ACB-2; angiotensin I; Ang.(1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction; renal failure; PCR primer; sex
                                                                                                                                   Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primer ace2e1c used in SSCP analysis of human ACE-2.

PCR primers AAA12742-43 were used for chromosome localisation of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as
                                                                     PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a humbject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat congestive heart failure, and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, angiotensin converting enzyme-2, ACE-2, angiotensin I; Ang.(1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure

PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure

The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polymuclectides. ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                                                                                                                                                                                                                                                                                              Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.
Human, angiotensin converting enzyme-2; ACE-2; therapy, hypertension, peptidyl dipeptidase A, blood pressure; hypotension; atherosclerosis; myocardial infarction; heart failure; arrhythmia; renal failure; inflammation; fertility; enzyme; PCR; primer; ss.

The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidyl dispeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is human ACE-2 exon 17 fragment
                                                                                                                                                                                                   Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or

The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polymuclectides. ACE-2 is also known as peptidyl dipeptidase A (BC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynuclectides. ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.1.5.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidyl dispeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, acute heart failure, myocardial infanction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCK primer used in single strand conformation
                  chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis, arhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used to amplify human ACE-2 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or
congestive heart failure, myocardial infarction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; angiotensin converting enzyme-2; ACB-2; therapy; hypertension; peptidab apptidase A; blood pressure; hypotension; atherosclerosis; myocardial infarction; heart failure; arrhythmia; renal failure; inflammation; fertility; enzyme; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACB-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.

The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidayl dispetidates A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The chronic heart failure, acute heart failure, envocated in the protein in a subject, atheronic heart failure, and least failure, and an and are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang.(1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or
Human, angiotensin converting enzyme-2; ACE-2; therapy, hypertension, peptidyl dipeptidase A; blood pressure; hypotension; atherosclerosis; myocardial infarction; heart failure; arrhythmia; renal failure;

The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, avocardial infarction, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is human ACE-2 exon 17 fragment polymorphic variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang.(1-9); blood presenze, hypertension; congestive heart failure; atherosclerosis; chronic heart failure, acute heart failure; myocardial infarction; renal failure; PCR primer; sex
                                                                                                                    Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR primers AAA12766-A12821 were used for single strand conformation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAA12738-39 represent nucleotide sequences containing a A to G polymorphism in intron 17 of human angiotensin converting enzyme-2 (ACE-2). AAA12739 represents the variant sequence, with position 13 representing the polymorphism. ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (I-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .;

(ACE-21. ACE-218 expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a CDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure

Isolated human polypeptide, known as angiotensin converting enzyme-2, useful for treating or preventing the development of an abnormal blood pressure or related diseases, e.g. hypertension, heart failure or myocardial infarction.

Example 10; Page 114; 218pp; English.

The invention relates to human angiotensin converting enzyme-2 (ACE-2) polypeptides and polynucleotides. ACE-2 is also known as peptidyl dipeptidase A (BC 3.4.15.1). Polypeptides of the invention are useful for atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases include hypertension, hypotension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction,

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describic ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1

                                                                                                                                                                                                    ó
production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22. HGDMLP-1 sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PCR primers AAA12766-A12821 were used for single strand conformation polymorphism (SSCP) analysis of human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 cDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang (1-9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure
                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; angiotensin converting enzyme-2; ACB-2; angiotensin I; Ang.(1-9); blood pressure; hypertension; congestive heart failure; atherosclerosis; chronic heart failure; acute heart failure; myocardial infarction; renal failure; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        enzyme-2 (ACE-2)

ACE-2 is also known as peptidyl dipeptidase A (EC 3.4.15.1). Polypeptides of the invention are useful for treating or preventing the development of abnormal blood pressure and diseases or disorders associated with the protein in a subject. The diseases or disorders associated with the protein in a subject. The diseases or disorders acute heart failure, congestive heart failure, atherosclerosis, arrhythmia and renal failure. They are also useful for treating inflammatory conditions and diseases relating to fertility. The present sequence is a PCR primer used in single strand conformation polymorphism (SSCP) analysis of human ACE-2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAQ57377
                                                                                                                                                                                                                                                             AAD32591
```

```
This is a ACE mRNA target sequence (nucleotide no. 1749) of an enzymatic RNA molecule (ribozyme) which cleaves mRNA associated with the development or maintenance of a cardiovascular condition. The concn. of the ribozyme necessary to effect a therapeutic treatment is lower than that of an antisense oligonucleotide and the specificity of action is higher. (Updated on 25-MAR-2003 to correct PN field.)

The present invention relates to a new method for detecting minority genomes, present at less than 50%, in a population of nucleic acids of a viral quasat-species and having at least one mutation with respect to the majority genome. The invention can be used for genetic diagnosis of viral infections, especially human immune deficiency virus and hepatitis B or C, particularly to detect memory minority genomes that are implicated in failure of antiviral therapy, so the method may make possible design of therapies customised for individual patients. The present nucleic acid sequence represents the VIH-MUT-12 DNA sequence that was used in the methods of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart;

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific blomolecule and/or amount specifically of hGDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as the protein assays used to replacement the concentration and in vaccines or for replacement therapy. The production, and in vaccines of replacement therapy. The production, and in vaccines of replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed production of the present directly from MIPO production of the present directly from WIPO production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser descrption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Shannon ME;

The present invention describes a human genome-derived myosin-like

CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1

CC can be used in gene therapy and vaccine production. The hGDMLP-1

CR mucleic acids can be used as probes to detect, characterise and quantify

CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to

CC provide initial substrates for the recombinant engineering of hGDMLP-1

CC provide initial substrates for the recombinant engineering of hGDMLP-1

CC provide initial substrates for the recombinant engineering of hGDMLP-1

CC provide initial substrates for the recombinant engineering of hGDMLP-1

CC captessing the proteins. The hGDMLP-1 proteins or polypeptides may be

considered as immunogens to raise antibodies that specifically recognise hGDMLP-1

CC used as immunogens to raise antibodies that specifically reconcentration

and/or amount specifically of hGDMLP proteins, as specific biomolecule

capture probes for surface-enhanced laser desorption ionisation, as

therapeutic supplement in patients having specific deficiency in hGDMLP-1

CR production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

colynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a

clisorder associated with the expression of hGDMLP-1 in particular heart

cand skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the

CC The present sequence in this patent did not form part of the printed

continue the exemplification of the present invention.

useful New isolated nucleic acid with at least one polymorphic position, use for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and autoimmune diseases.

Disclosure; Page 780; 977pp; English.

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNBP2), bradykinin receptor B1 (RDKRB1), acachykinin receptor B2 (RDKRB2), angiotensin converting enzyme 1 (KLKI), bradykinin receptor B2 (RDKRB2), angiotensin converting enzyme colymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5' and 3' flanking genomic obtaining the sample from one or more individuals and determining the conclusion as more polymorphic positions in a gene concing a protein selected from one or more polymorphic positions in a gene encoding a protein selected from the group above; (3) constructing (M2) haplotypes using the genes comprising grouping at least two nucleic acids and individual at risk of developing a disorder cuby administration of an ACE inhibitor and/or vasopeptidase inhibitor using the polymorphic data; (5) a library of mucleic acids, each of which comprising obtaining a nucleic acid sample, determining the individual comprising obtaining a nucleic acid sample, determining the individual comprising obtaining a nucleic acid sample, tearmining the compension with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, preventing various disorders such as angioedaema and diseases which

involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular hypertension, heart failure, myocardial infarction, ventricular strongly, vascular diseases, aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis and/or atherosclerosis, and hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence represents or contains the region surrounding a single- uncleotide polymorphism in one of the genes encoding one of the proteins listed above 858888888888888888

Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such as class 1/2 HLA comprises identifying all possible nucleotide sequences of specific length.

Claim 14; Page 56; 66pp; English.

The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used to type the human leukocyte antigen genes (HLA) and 16s rRNA genes in

The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 expressing usiants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-production, and in vaccines or for replacement therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                           Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart;

The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed
                                                                                              specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence

interest actual samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically electronic electronic and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1 in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO content of the present directly from wipo.int/pub/published_pct_sequence nucleic acids can be used as probes to detect, characterise and quantify

New isolated nucleic acid with at least one polymorphic position, use for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and autoimmune diseases.

Example 3; Page 915; 977pp; English.

The invention relates to an isolated mucleic acid ison a numbal gene encoding aminopeptidase to an isolated mucleic acid isolated mucleic aciding aminopeptidase p (XPKEP2), bradykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein (1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensian converting enzyme C2 (ACE2) or protease inhibitor 4 (114), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position. Also included are (1) a probe that hybridises to a cobtaining the sample from one or more individuals and determining the mucleic acid sample comprising additional 5, and 3, flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample comprising concerning approach acid sequence at one or more individuals and determining the encoding a protein selected from the group above; (3) constructing (M2) haplotypes using the genes comprising grouping at least two nucleic acids each of which comprises one or more polymorphic positions within a a disorder cupin administration of an ACE inhibitor and/or vasopeptidase inhibitor using the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the individual comprising obtaining a nucleic acid sample, determining at least one position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, revenit and proper and administrations and a such as anglocement and diseases which involve and order and compositions are useful for detecting, and administrations and a such as anglocement and administration. hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polymucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is a genotyping PCR primer for the gene encoding one of the proteins listed above preventing various disorders such as angloceuseum and accomas, Crohn's involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis and/or atherosclerosis, and artery diseases, inflammatory The invention relates to an isolated nucleic acid from a human

Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such as class 1/2 HLA comprises identifying all possible nucleotide sequences of
classification of genes. This can then be used to predict protein sequence and structure, in organ donation to march the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequence analysis; sequencing; protein sequence; protein structure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in

                                                                                                                                                                                                                                                                                         The present invention describes a protein (I) having transporter activity. A gene encoding (I) can be used as a probe for finding a monologous gene encoding another transporter protein. The present sequence represents a PCR primer for mouse MOT transporter protein, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such as class 1/2 HLA comprises identifying all possible nucleotide sequences of

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises for a least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotbrobes is useful in in situ hybridisation, in Southern, Northern or dotprime extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been containing a sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly containing the containing the containing the containing and probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly

The present invention relates to reverse transcription of RNA using a homopolymeric nucleic acid and at least one of reverse transcriptase, DNA polymerase, oligonucleotide primer/s, one or more nucleotides. The method is used to generate chain from RNA templates, specifically in RT-polymerase chain reaction (PCR), for various industrial, medical or forensic purposes. The method is sensitive and efficient
                                                                                                                                                                                                                                                                                                                                                                 Composition for reverse transcription for use in medicine and forensiss, comprises a homopolymeric nucleic acid to prevent interference between

The present invention describes a method (MI) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Cryptococcus neoformans, Candida albicans and infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus funigatuts, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents completed from Onchovarva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC petecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ```
The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in particular
                                                                                                                                                                                                                  Sequence 25 BP; 2 A; 2 C; 4 G; 17 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for
sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1, heart;

expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP conservations as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The colymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cat fip.wipo.int/pub/published_pct_sequence

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for protein variants having desired phenotypic improvements, and for capture probes in munogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines of for replacement therapy. The concentration of selected muscle disorders. HGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart on the present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes are detecting the hybridisation. The nucleic acid probes are detecting the hybridisation. The nucleic acid probes are detecting the hybridisation and solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence form in the microarray is the sequence form in the microarray is the sequence form in the microarray. from USPTO at segdata.uspto.goc/sequence.html

New isolated nucleic acid with at least one polymorphic position, useful for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and

autoimmune diseases.

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (KPNEP2), bradykinin receptor B1 (BACRB1), cleaterase inhibitor (CINH), kallikrein (C tachykinin receptor B2 (BDCRB2), angiotensin converting enzyme (C tachykinin receptor B2 (BDCRB2), angiotensin converting enzyme (EXLKI), bradykinin receptor B2 (BDCRB2), angiotensin converting enzyme (C 2 (ACE2) or protease inhibitor 4 (FIF4), comprising at least one polymorphic position as provided in the detailed summary of single mucleotide polymorphisms comprising additional 5 and 3 flanking genomic C sequence; (2) analysing (MI) at least one nucleic acid sample comprising cobtaining the sample from one or more individuals and determining the nucleic acid sequence at one or more polymorphic positions in a gene concising a protein selected from the group above; (3) constructing (M2) c haplotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder c upon administration of an ACE inhibitor and/or vasopeptidase inhibitor using the polymorphic obsitions within a gene encoding a human protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acids sample, determining at least one polymorphic position, and comparing or uncleotide present in at least one polymorphic position, are useful for detecting, disaposing, treating, preventing various disorders such as angiodenema and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, converse, inclive recordarial infarction, ventricular converser, and cardiovascular diseases inke angina percenting various disorders such as angiotenema and diseases, coronary conversementivity vascular diseases; aneurysm, embolism, thrombosis, coronary conversementivity varantions. Disclosure; Page 785; 977pp; English.

hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (Copp) and entercoolitis (many other polymucleotides are listed in the specification). The polymucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence represents or contains the region surrounding a single- uncleotide polymorphism in one of the genes encoding one of the proteins listed above

Escherichia coli SSR loci, ycgW amplifying forward PCR primer.

WO200175038-A2

```
The invention relates to a method of classifying or typing a prokaryote to a class or a type. The method involves characterising at least one hyperpolymorphic mono or dinuclectide sequence repeat (SSR) locus in a genome of the prokaryote and based on a characterisation of the prokaryote and based on a characterisation of the hyperpolymorphic SSR, classifying or typing the prokaryote to a class or a type. This method provides an effective, readily implementable, rapid and currate tool for classifying or typing prokaryote to a class or a type. The method is useful for classifying or typing prokaryote of the genera Escherichia, Aquifex, Treponema, Bacillus, Listeria, and cypocaterial, and M. tuberculosis and also Haemophilius, Mycoplasma, Helicobacter, Methanococcus, Archaeoglobus and Synechocystis, such as H. influenzae, M. pneumoniae, H. pylori, M. jannaschii, A. fulgidus and influenzae, M. pneumoniae, H. pylori, M. jannaschii, A. fulgidus and sieful in research, medical and food safety diagnostics. The present sequence is a primer used to amplify E. coli SSR loci
                                                                                                                                                                                                                                                                                                                                                                                                                Classification and typing of prokaryotes, e.g. Escherichia coli, by characterizing hyperpolymorphic simple sequence repeats in prokaryote genomes and classifying based on the characterization of the sequence

LIGE INVENTION LIGITATES TO MUNICAL ALT SUPPLIANCE.

(AAGG6793), nucleic acids encoding it (AAH76954), and a method for the recombinant production of ATP-dependent serine hydrolase 9. The protein additionally class an antagonist of ATP-dependent serine hydrolase 9 for the reapeutic use, and an antibody which specifically binds to ATP-dependent serine hydrolase 9, and carpetter serine hydrolase 9, ATP-dependent serine hydrolase 9, and nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV (human conditions. The protein may also be used to screen for modulators of its conditions. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as primer for nucleic acid amplification reactions or as a primer for nucleic acid amplification reactions or as a primer law and ampliance or in producing gene chips or microarrays. Sequences AAH76955-AAH76956 represent reverse transcription-in the human and an exemplification of the invention to human and an exemplification of the invention to
                                                                                                                                                                                                                                                   New human ATP-dependent serine hydrolase 9 for diagnosing and treating malignant tumor, hemopathy, human immunodeficiency virus infection, immunological diseases and various inflammations.
                                                                                                                                                                                                                                                                                                                                                                 invention relates to human ATP-dependent serine hydrolase 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The invention relates to an oligonucleotide array (1) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (1) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (1). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an oligonucleotide array (1) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (1) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Array comprising adapter sequences useful for immobilizing or detecting target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                   ng adapter sequences useful for immobilizing or detecting acid sequence, has different addresses comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.5%; Score 17.2; DB 1; Length 24; 86.4%; Pred. and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an oligonucleotide array (1) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (1) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (1). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker contained in added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the cresultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent CR represent PCR primers for human chromosome 219221, which are
                                                                                                                             Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                specifically claimed for use in the present invention
                                                                     Human chromosome 1p36-35 PCR primer SEQ ID NO:1879.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 20 BP; 6 A; 1 C; 11 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a composition, which comprises molecules for use tags or tag complements. Each molecule comprises an oligonucleotide selected from a set of oligonucleotides based on numeral identifiers (numerals 1-3) corresponding to the pattern of nucleotide bases present in 1168 nucleotides were found to be non-cross hybridising. The composition is useful as a tag or tag complement, in analysing a biological sample of for the presence of a mutation or polymorphism at a locus in a nucleic for the presence of a mutation or polymorphism at a locus in a nucleic acid, and in determining the presence of a target suspected of being contained in a mixture. Also for use in a wide variety of research, medical, or industrial applications, e.g. identification of disease-contained in a mixture and a polymorleotides in diagnostic assays, screening for clones of novel target polynucleotides, identification of specific polymucleotides in blots of mixtures of polymucleotides, therapeutic blocking of inappropriately expressed genes or DNA sequencing. The polymucleotides for inappropriately expressed genes or DNA sequencing. The polymucleotides for inappropriately expressed genes or parallel processing of analytes. The use of the polymucleotides provides minimal cross-hybridisation or cross-talk during the sorting process. Thus, any sequence within the family of sequences will not significantly cross-hybridise with any other sequence derived from that family, making it suitable for highly parallel processing of analytes. Abs61529-Abs62696 represent oligonucleotide tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polynucleotides comprising minimally cross-hybridizing nucleotide sequences, useful as tags or tag complements for use in a wide variety of research, medical or industrial applications, e.g. in diagnostic assays

The sequences at number of polymorphic sites are also provided diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

CHORD KONG NEW GAR210708-33 were used to amplify exons 1 to 11 of human HKNG1 (Hong Kong new gene 1). HKNG1 is a gene associated with bipolar affective disorder (BAD). HKNNI polymolated are useful to identify compounds modulating HKNG1 gene expression or extivity. Compounds inhibiting or enhancing HKNG1 gene expression or activity, in individuals can then be administered therapetically to treat KNG1-mediated disorders, especially neuropsychiatric disorders e.g. BAD, schizophrenia, or HKNG1-mediated myopia disorders, such as early-onset therapy techniques to treat such disorders. They are also useful in diagnosis to identify individuals having, or at risk of developing, HKNG1 diagnosis to identify individuals having, or at risk of developing, HKNG1 emediated disorders due to mutations in the HKNG1 gene. Such mutations especially result in the production of a protein with a different sequence to the human full-length HKNG1 polypeptide or splice variant sequences, especially the substitution of a lysine for a glutamic acid at residue 202 or 184. The polymucleotides are also useful in gene mapping, to produce probes or primers to identify similar sequences (e.g. mutants).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

The present invention relates to subtilisin 10 and coding sequence (see AAH48010 and AAG64206). The subtilisin and coding sequence are applicable in the diagnosis and treatment of malignant tumour, heamopathy, HIV infection, immunological diseases and inflammation. The present sequence
                                                                                                                                                                                                                                                                                                 The present invention provides the protein, cDNA and gene of human interleukin-4 (ILI4). The coding sequences for this protein contain single nucleotide polymorphisms (SNPs) which may be associated with differences in susceptibility to atopy, inflammatory and immune diseases and different drug responses. They may also be used in applications such as forensic and paternity testing and studying population diversity and anthropological lineage. The IL4 gene is found on human chromosome 5q31.1
                                                                                                                               Polynucleotide comprising novel single nucleotide polymorphisms in human interleukin-4 gene for use in studying expression, function of interleukin-4, in developing drugs, diagnosis and treatment of immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Subtilisin 10; anti-HIV; antinflammatory; immunostimulatory; cytostatic; malignant tumour; haemopathy; HIV infection; immunological disease; inflammation; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Subtilisin 10 and encoded polynucleotide, applicable in diagnosis and treatment of malignant tumor, hemopathy, HIV infection, immunological diseases and inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid molecule comprising a nucleotide sequence that encodes a Hong Kong New Gene (HKNG) 1 gene product. The human gene for HRNG1 is located on chromosome 18p in an area associated with bipolar affective disorder. BAD. Also included are an expression vector comprising the nucleic acid, a host cell expressing the nucleic acid, an anti-HRNG1 antibody, a method of identifying modulators of HKNG1, and identifying an individual (at risk of) having HKNG1.

The colymorphism that correlates with an HKNG1 allele associated with the disorder, where the presence of the polymorphism indicates that the clasorder, where the presence of the polymorphism indicates that the clasorder, where the presence of the polymorphism indicates that the colecule) compound which modulates (inhibits or potentiates) expression of a HKNG1 gene or gene product in a human individual is useful for the treatment of a HKNG1-mediated disorder such as bipolar affective disorder (BAD), severe bipolar affective (mood) disorder (BPD) and schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ·:

The present invention describes applying the polypeptide in treating various diseases, such as malignant tumours, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. Also issclosed are the antagonist resisting the polypeptide and its treatment effect, and the application of the polynucleotides encoding human clathrin light chain 11.44. This sequence represents a reverse transcriptase PCR primer used to isolate cDNA encoding the human clathrin
is a PCR primer, which was used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human clathrin light chain 11.44 polypeptide for treating malignant tumors, hemopathy, human immunodeficiency virus infection, immunological

The present invention describes a method (M1) for designing capture oligonucleotide probes (1) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents of Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, cancer is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning and the support at the support at the support at the support and process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particular sites and identifying if ligation of the oligonuclectide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nuclectide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergilus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. The sequence shows an upstream PCR primer for in vitro amplification of bovine microsatellite sequences obtd. by screening library of bovine Mbol DNA fragments of between 250 and 500 bp with an (Ac)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross- hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at microsatellites is summarised in the specification and indexed herein microsatellites is summarised in the specification and indexed herein (see below). For each such microsatellite sequence sufficient information of the corresp. microsatellite (using the program oPTIPRIM). The microsatellites may be used to identify individuals, for parentage the required program oPTIPRIM). The microsatellites may be used to identify individuals, for parentage involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34440. ```
RNA was isolated from the plasma of human patients positive for NANBH virus (strain HC-J8). Single stranded cDNA was synthesised using the antisense primer #232 and reverse transcriptase. A dATP tail was added to the 3' terminus by terminal deoxyuncleotidyl transferase and the cDNA amplified by PCR using the sense primer #242 and the antisense primer #232. The resulting PCR prod. in clones AAC15/33, AAC15/34 and AAC15/35 corresponded to nt 602/6889 of the NANBH virus HC-J8 strain. The PCR prod. was subcloned to M13 phage vector, then consensus sequence of the respective clones of each region was determined. See also AAQ38172-221.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a compound (I) 8-80 nucleobases in length targeted to a nucleic acid molecule encoding hydroxysteroid 11-beta dehydrogenase 1, inhibiting expression of hydroxysteroid 11-beta dehydrogenase 1. The methods and compositions of the present invention are useful for treating disorders associated with hydroxysteroid 11-beta
                                         Polynucleotide(s), polypeptide(s) and antibodies of NANBH virus - useful for detecting NANBH, as a vaccine and for screening blood samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compounds useful for treating disorders associated with hydroxysteroid 11-beta dehydrogenase 1 expression, such as osteoporosis, depression and metabolic disorders like obesity, diabetes and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of PCR primer BETA101, which was used in the RCR amplification of coffee alpha-D-galactosidase cDNA (see AcC5702). cDNA was obtained from a Coffea arabica var. Caturra T2308 cDNA library constructed from mRNA extracted at 30 weeks after flowering. The invention aims to increase the solubility of coffee galactomannans by increasing their galactose branching. The strategy adopted is to reduce the endogenous level of alpha D-galactosidase activity, preferably by introducing an antisense copy of its cDNA under the control of the coffee
                                                                                                                                                                                                                                                                                                                                                                                     where its

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This primer is used for the cloning of the human endonuclease III cDNA. The endonuclease III when purified greater than 500-fold, demonstrates pyrimidine hydrate and thymine glycol DNA-glycosylase activity, and lyase activity, and reductively cross-links with a thymine glycol containing oligodeoxynucleotide. The endonuclease III is a DNA damage repair modulator and can be used to treat diseases or disorders associated with DNA damage in, e.g. UV or gamma irradiated, or chemically oxidised tissues. Susceptibility to DNA damage can be determined by measuring endonuclease III activity in Lissues, while the products can be used to treat or prevent cancers or screen drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          d mammalian endonuclease III - having DNA damage repair activity, to diagnose and treat conditions associated with DNA damage.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 97 ORFS are shown. The proteins are variously cell envelope proteins, cytoplasmic proteins, secreted proteins or other cellular proteins, probes containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleicides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccine, probe, diagnostic, ORF, cell envelope protein, secreted protein, cellular protein, ds.

Helicobacter pylori nucleic acids and proteins - used to develop products for the detection, prevention and treatment of H. pylori infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the

The present invention relates to the human uncoupling protein 3 (mitochondrial, proton carrier) (UCP3) gene and polymorphisms. The polymorphisms are associated with obesity, especially diabetes mellitus associated obesity. They polymorphisms may be identified and analysed to determine whether an individual is susceptible to obesity and may be used as the basis for targeted design of drugs to treat obesity. The present sequence was used in the identification and amplification of UCP3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        UCP3; uncoupling protein 3; polymorphism; obesity; diabetes mellitus; ss.
                                                                                                                                                       by Helicobacter pylori. The vaccine contains at least one isolated H. pylori polypeptide, or its fragments, in a carrier, where the carrier is a Salmonella, Vibrio cholerae or Shigella vector containing a nucleic acid encoding the H. pylori polypeptide. The vaccines induce humoral and cellular immune responses. The vaccines are used to treat or prevent infections by H. pylori. The invention provides nucleic acid sequences AAX75779 to AAX75837 encoding H. pylori outer membrane polypeptides
                                                                                                                                           The invention relates to a vaccine for preventing or treating infections
                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding uncoupling protein 3 (mitochondrial, proton carrier) (UCP3) proteins comprising single nucleotide polymorphisms, useful for the design of drugs for treating obesity.
                                                                                                                                                                                                                                                                                                                                                                          .

```
The present sequence represents a potential triple-helix forming region. Occuprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and least one complex of anchor DNA, attached to a solid support, and designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the test sequence. Triplex formation results in displacement of the presence sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A third-strand binding site (AAT48456) is located in the second intron of the human beta-globin gene, beginning at position 2825 of the sequence given in AAT48454. It comprises 21 uninterrupted pyrimidines in the coding strand. Third-strand binding sites (see also AAT48455-59) can be used in targetted DNA replacement (TDR). This method for genetic defect repair involves targetting third strands (see also AAT48457-70) to native DNA sequences to induce DNA damage that stimulates homologous recombination with an introduced donor nucleic acid strand. The method is used to correct mutations in a target region, esp. for treatment of betathalassaemia and sickle cell anaemia. TDR is highly specific and, since the corrected gene is in its native chromosome, the cure is permanent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 °,

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at number of polymorphic sites are also provided diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                        Ireland JS, Bolk S, Daley GQ, Mccarthy JJ,
                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and

Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic

Claim 18; SEQ ID NO 568; 233pp; English.

The present invention describes an isolated mucleic acid (I) comprising a single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid baving mulcicus SNPs or Altahatic halbut SNPs; and state SNPs, Orecohronia miloticus SNPs or Altahatic halbut SNPs; and (ii) a nucleic acid having mucleotide sequence that hybridises to and (ii) an isolated oligonucleotide (II) comprising at least (I) or its complement under highly stringent hybridisation conditions. Also described: (I) an isolated oligonucleotide (II) comprising at least (II) comprise and seabass polymorphic sites, or their complement; (2) a primer pair (III) suitable for use in PCR, comprising two (II) capable of amplifying a nucleotide sequence chosen from S. salar SNPs, cod niloticus MnPs, O. miloticus microsatellites, Atlantic halbut SNPs, cod polymorphic sites and seabass polymorphic sites, and determining (MI) the comprising a collection of candidate parent genotype database congine of tiles ample genotype represents a distinct origin, and comparing a cample genotype and one of the candidate parent genotype database. Where a match between the sample genotype and one of the candidate parent genotype database, where a match between the sample genotype and one of the candidate parent genotype determining the origin of the sample (MI) is useful for determining the origin of the sample (MI) is useful for determining the comprising or a fair sample, which one or more (II) derived from nucleotide sequence of S. salar, Tilapia, O. miloticus contacting the sample containing nucleic acid molecule comprising SNP in a sample, which one or more (II) derived from nucleotide sequence of S. salar SNPs and identifying nucleic acid molecule comprising contacting the sample containing the sample contacting the sample containing used in the exemplification of the present invention

The present invention relates to an isolated G-protein coupled-receptor (GPCRX) polypeptide and its nucleic acid. GPCR is useful in treating or preventing a GPCRX-associated disorder and the predisposition to a disease associated with altered expression levels of this polypeptide. GPCR is useful for treating or preventing disorders such as; diabetes, obesity, anorexia, cancer, neurodegenerative disorders, latchimer's, parkinson's, haematopoietic disorders, immune disorders, asthma, cardiac disorders, Crohn's disease, angina pectoris, ulcer, schizophrenia, depression, dementia, Huntington's disease, Gilles de la Tourette's syndrome, human immuno deficiency virus (HIV), hypotension, hypertension and osteoporosis. GPCR can be used as an immunogen to produce antibodies geniatic for the invention, as vaccines and in screening for potential agonistic and anteagonistic compounds. The present sequence is human GPCR
                                                                                                                                                                                                                                                                                       New G-protein coupled-receptor polypeptides and nucleic acids encoding them are useful in therapeutics e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Toxicologically relevant gene; toxicological response; PCR primer; ss.

RESULT 125 AAZ70487, ሯ The present invention describes a method (MI) for determining a toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicity, and so described: (1) an array comprising one or more polymolectides selected from the genes corresponding to the partial sequences given in AB28.842 to AB284764, or their fragments of at least 20 nucleotides, or homologues from the gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject of a known toxic pharmaceutical or industrial agent, comprising: (a) exposing cells to an agent, (b) obtaining the test gene expression profile or industrial agent, compraining the test profile to the expression profile of agene with a similar function or toxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of agene with a similar function or exposure to other known toxic compounds. The methods are useful for exposure to other known toxic compounds. The methods are useful for prefit or system level. The arrays comprising the human genes are useful for a prefit or system level. The arrays comprising the human genes are useful for a prefit or system level. Determining a toxicological response to an agent, useful for screening of drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicological screening of drugs, pharmaceutical compounds and chemicals Schmeiser K; Kier LD, Sequence 22 BP; 8 A; 4 C; 7 G; 3 T; 0 U; 0 Other; Neft RE, Dunn RT, Adkins K, Pickett GG, PHASE-1 MOLECULAR TOXICOLOGY INC Claim 1; Page 341; 455pp; English. (UYNE-) UNIV NEBRASKA

PCR primers ABV72571-75 were used to obtain 5' deletions of a yeast actoblo oxidase I (AOX1) promoter. AOX1 catalyses the oxidation of methanol to formaldehyde. The AOX1 promoter is an inducible promoter, primarily induced by methanol and starvation, and repressed in response tegions within the promoter. Regulatory regions within the promoter. Regulatory regions within the AOX1 promoter can be used to produce expression cassettes and vectors, which are useful for protein production. The regulatory sequences are useful to increase expression of genes of interest in a variety of host cells, in a research setting to further characterize promoter function and to study peroxisome biogenesis. They are also useful as probes Novel alcohol oxidase 1 regulatory nucleotide sequences useful for enhancing expression of genes of interest in a variety of host cells, Gaps 0 Match 0.5%; Score 16.2; DB 1; Length 22; Local Similarity 85.7%; Pred.                   primers for the biallelic markers. The biallelic markers for the biallelic markers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents are methods, as well as the characterisation of the pharmaceutical gents acting on a disease as well as other treatment. The invention relates to the isolation of novel NOVX protein and genes encoding them or sequences that are at least 95% identical to these. This sequence corresponds to a primer used to PCR amplify a fragment of NOV3a cDNA (ACCS9774) for use as a probe to detect expression of the NOV3a gene. NOV3a protein has high homology to LMW T kinin-like proteins. The polypeptide is useful for preparing a composition for treating or preventing e.g., cancer

The invention relates to a novel method for identifying a Frizzled-4 (FZD4) modulating agent. The method comprises contacting a compound with a rEZD4 modulating agent. The method comprises contacting a compound with a cell expressing an FZD4 polypeptide, and determining the difference in the biological activity or expression of the FZD4 polypeptide compared with when the compound is not present. The immunodulatory compounds of the invention can have the follwing activities of ophthalmological, vasotropic, antiniflammatory, vulnerary, osteopathic, antimicrobial, antipsoriatic, and antidiabetic. The method is useful for identifying modulators of FZD4, and such modulators are useful in treating diseases related to FZD4, expression or activity. The modulators are particularly useful in treating e.g. familial exudative vitreoretinopathy, retinopathy of prematurity, Coat's disease, Norrie disease, retinal angiomatosis, ocular toxocariasis, retinoplastoma, retinitis pigmentosa. The modulators are also useful for treating other diseases involving the physiological and pathological processes of neovascularisation, such as indications that may require stimulation of

Mitogen activated protein kinase sinA oligonucleotide SEQ ID NO:457.

(first entry)

29-JAN-2004

ADE29835 standard; RNA; 19 BP.

ADE2983

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of debte-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GRNESEQ files AAQ75547.Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The
neovascularisation (e.g. myocardial ischaemia, coronary artery disease, wound healing, or fracture and tendon repair), indications that may require inhibition of neovascularisation (e.g. cancer tumour growth and metastatis, ocular neovascularisation, bone and cartilage destruction, inflammatory and infectious diseases), indications that require vascular remodeling (e.g. psoriasis or pre-eclampsia), and indications that require inhibition of neovascularisation (e.g. respiratory distress, peritoneal sclerosis, or diabetes). This polymucleotide sequence represents a PCR primer relating to the FZD4 gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed

that downrequiates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of sinA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) certors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antidabetic, antinflammatory, antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antispositatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obseity; diabetes types I can in it a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; pharmacogaenomics; identification and validation; genetic engineering; pharmacogaenomics; The present invention describes a short interfering nucleic acid (siNA) Sequence 19 BP; 3 A; 5 C; 5 G; 0 T; 6 U; 0 Other; polymorphisms). The present sequence represents in the exemplification of the present invention. Best Local Similarity Query Match

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase (WAPK) genes Py RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo calliance of siNA; (3) conjugates and/or complexes of siNA; and (4) cectors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antibacterial, antirhenmator, antiarbritic, antipsorlatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I and II; a wide range of tumours, and inflammatory diabetes types I call in a wide range of tumours, and inflammatory diabetes; target disease). They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; diagnosis; target dentification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                       short interfering nucleic acid; siNA; downregulation; inhibition; mitogen-activated protein kinase; MAP kinase; MAPK; RNA interference; cytostatic; anorectic; antidiabetic; antiinflammatory; antiasthmatic; immunosuppressive; antibacterial; antirheumatic; antiarthritic; antiportatic; gastrointestinal; obesity; diabetes; tumour; inflammatory disease; asthma; septic shock; treumatoid arthritis; psoriasis; inflammatory bowel disease; drug screening; genetic engineering; pharmacogenomic; gene mapping; ss.
                                                                                                                                                                                                                                                                    Mitogen activated protein kinase siNA oligonucleotide SEQ ID NO:352.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chowrira B;

ö ö Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3 -directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Bach library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41077-8 amplify clone pm2367 which comprises the GS HUMGS001298 (T20298), located on chromosome 4 Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp. mRNA in specific human tissues. PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis, pneumopathy in breast feeding infants; and veneral lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Probe for peripheral benzodiazepine receptor associated protein-1 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; peripheral benzodiazepine receptor associated protein-1; PRAX-peripheral benzodiazepine receptor; chromosome 17; central nervous system; namune system; gene therapy; PRAX-1 deficiency condition; endocrine system; probe; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes the preparation of immortalized human hair papila cells (HPC). The method comprises transformation of HPC with an SV40 viral Large T-antigen gene with deleted replication initiation point. The immortalized HPC can be used in a soreening method for a hair growth agent, by culture of immortalized HPC in the presence of a Bubstance to be tested and observation of the growth of the immortalized HPC. HPC is also used in development of hair growth stimulating agents. The present sequence represents a PCR primer, which is used in the course
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; preumopathy; venereal lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immortalised human hair papila cells used for evaluation of hair growth agent - are prepared by transformation of human hair papila cells with gene with deleted replication initiation point.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ÷
                                                                                                   AA236990-237023 represent probes for the polynucleotides encoding a human peripheral benzodiazepine receptor associated protein-1, designated PRAX-1. The probes may also function as PCR primers. PRAX-1 interacts specifically with the peripheral benzodiazepine receptor. The PRAX-1 gene is localised on chromosome 17 in the q22-q23 region. The gene is associated with markers of pathologies of the central nervous system or immune system. The PRAX-1 nucleic acid is useful in gene therapy (of PRAX-1 deficiency conditions, e.g. disorders of the central nervous, immune or endocrine systems; as a source of diagnostic primers and probes (see AZ36990-237023) and of antisense therapeutics; for recombinant production of the PRAX-1 protein; and for detecting allelic variants, mutations, insertions, loss of heterozygosity and gene rearrangements in the PRAX-1 gene. The PRAX-1 protein is used to raise rearrangements in the PRAX-1 gene. The PRAX-1 protein is used to raise pepcific antibodies and to screen for specific modulators (potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Angiotensin-converting enzyme, Zace2, useful for treating inflammatory bowel disease, e.g. Crohn's disease and ulcerative colitis, or diseases associated with inflammation such as arthritis and enterocolitis.
                                                                                                                                                                                                                                                                                           therapeutic agents). The antibodies are used as immunoassay reagents, e.g. for diagnosis of abnormal expression or accumulation of PRAX-1

The invention relates to the metalloenzyme Zace2. Zace2, an angiotensin-
converting enzyme is a zinc metallopeptidase that plays roles in blood
pressure regulation and fertility. Zace2 can be expressed by standard
recombinant methodology. Zace2 polypeptides are useful for treating an
inflammatory bowel disease (e.g. Crohn's disease and ulcerative colitis),
diseases associated with inflammation like arthritis and enterocolitis,
cas targets for identifying modulators of zinc protease activity, for
screening or identifying modulators of zinc protease activity, for
screening or identifying mew angiotensin-converting enzyme (ACE)
inhibitors, and as a basis for rational drug design for inhibitory
condition and localizing Zace2 gene expression of a
Zace2 gene in a biological sample, as probes for in vivo diagnosis and
for determine whether a subject s chromosomes contain a mutation in the Zace2
gene, and to detect aberrations associated with the Zace2 locus.
Inhibitors of ACE are used for treating hypertension of various
conditions, including left ventricular systolic dysfunction, progressive
to dysfunction, and treatment of atherosciencisis. Zace2 agonists may be
the dysfunction, and treatment of atherosciencisis. Zace2 agonists may be
to dysfunction, and treatment of atherosciencisis. Zace2 agonists may be
to infertility. Sequences AACE8411.72 represent PCR primers for generating a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
